

# Impact of Teacher Education: Evidence from the IEA TEDS-M

Beatrice Avalos-Bevan

Associate Researcher

Centre for Advanced Research in Education,

U. of Chile

# A long history of development

- Initial discussions around 2003
- A preliminary study known as PTEDS covering a few countries
- Within IEA country members discussion on participation
- Gradual incorporation of 17 countries
- Official start of most of interested countries around 2006
- Not quite concluded as International Report has not been published, but on the way.

# Main questions

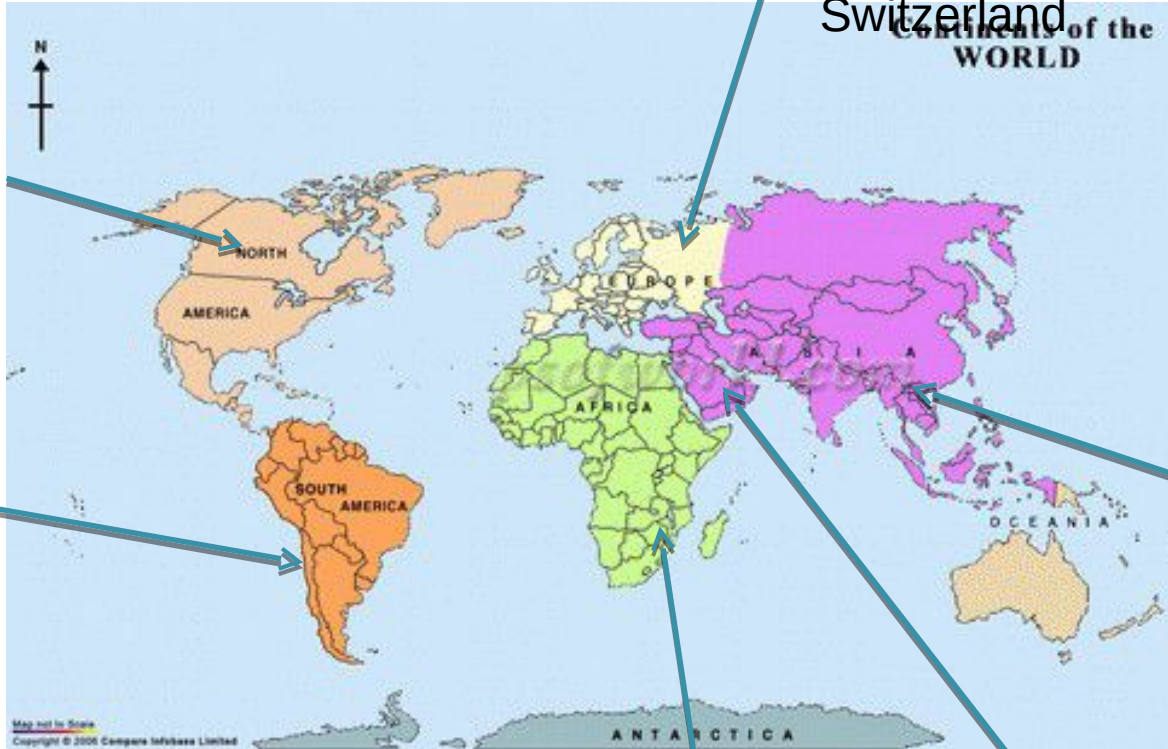

- What are the policies that support primary and secondary teachers' achieved level and depth of mathematics and related teaching knowledge?
- What learning opportunities available to prospective teachers allow them to achieve that knowledge?
- What are the level and depth of mathematics and related teaching knowledge attained by prospective primary and secondary teachers at the end of their initial teacher education?

# Participating countries

Germany  
Spain  
Georgia  
Norway  
Poland  
Russia,  
Switzerland

Canada  
USA

Chile

Malaysia  
Philippines  
Singapore  
Thailand  
Chinese  
Taipei

Botswana

Oman

# Variation among participating countries

- Very large population: Russian Federation, USA, Philippines, Germany
- High GDP per head in PPP (69 countries): Singapore (9) USA (12), Canada (19), Germany (29), Spain (35); Taiwan (37) Oman (51).
- GDP per head other countries: Botswana, Chile, Poland (middle), Philippines (low)
- Low primary enrolment: Oman (75%)
- High secondary enrolment: Spain, Canada, Germany
- Highest tertiary enrolment: USA
  - Source: The Economist, Pocket World in Figures 2011.

# International coordination

Michigan State University:  
M. T. Tatto, International Coordinator;  
J. Schwille & Sh. Senk.

Australian Council of Educational  
Research  
L. Ingvarson, R. Peck & G. Rowley

IEA Hamburg. Technical support

# Process

- National & programme coordinators in each country
- International coordination meetings during the study (2006-2010)
- Focused and training meetings: data management, curriculum analysis
- Constant communication (e-mail & web page)
- Constant feedback to national coordinators during process

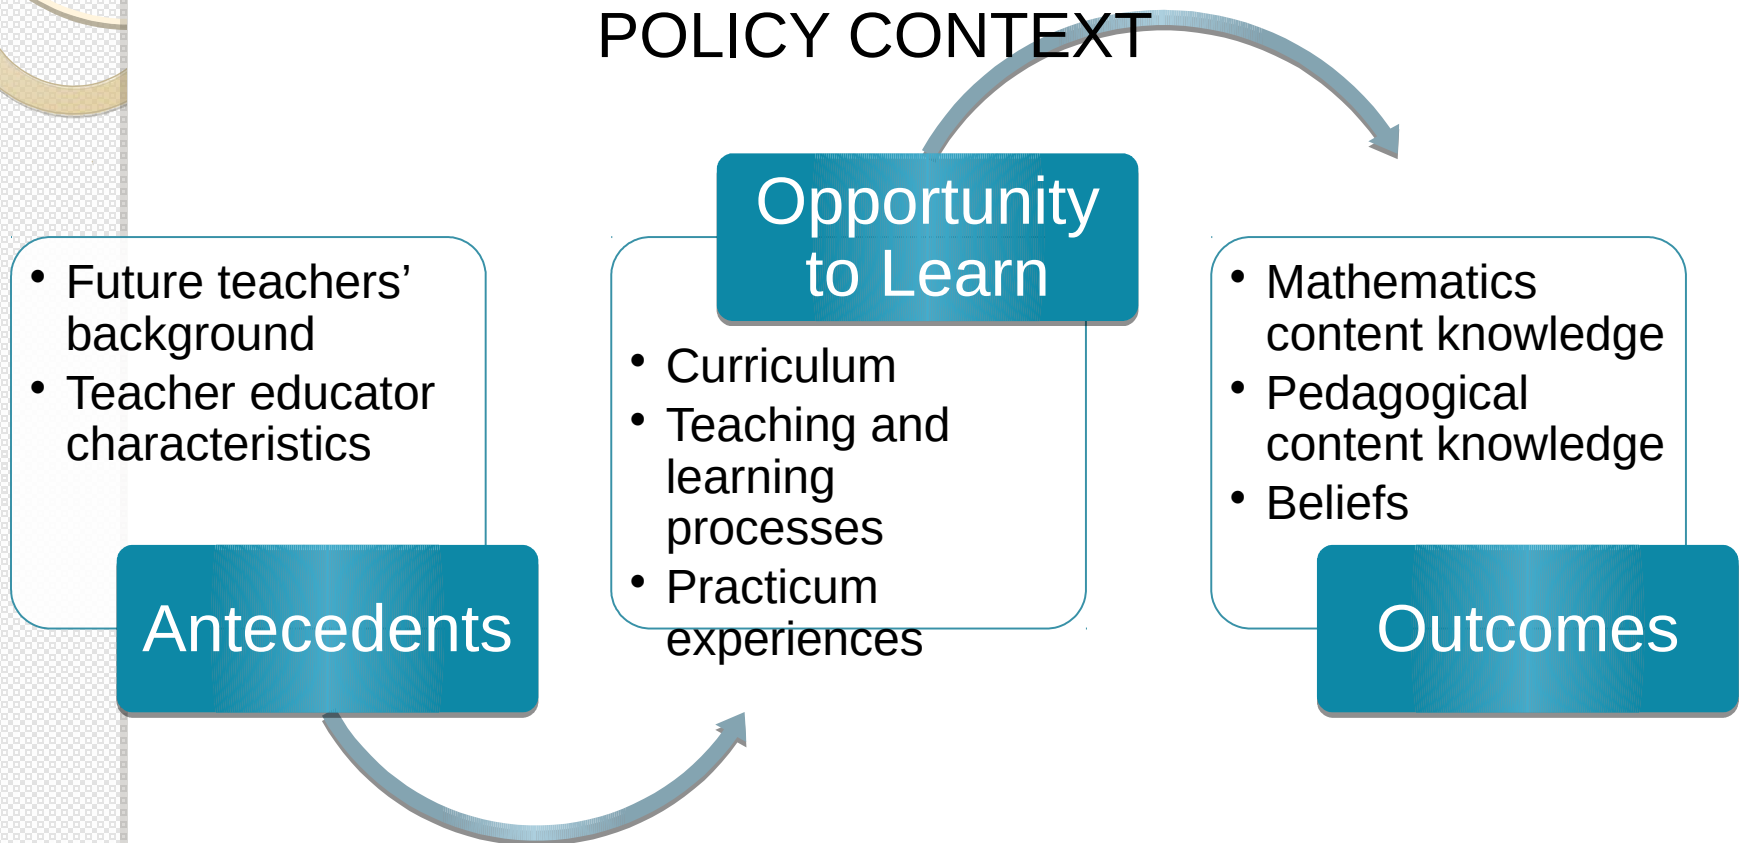

# The key targets of the study

- *Study of context:* to understand the policy environment of each country relating to teachers and teacher education and the characteristics of preparation programmes
- *The opportunity to learn:* to estimate the range of opportunities offered by the curriculum and teaching strategies in teacher education institutions
- *Level of preparation:* To assess the mathematics content and pedagogy knowledge as well as beliefs about teaching of prospective teachers.

# The conceptual framework

# The programmes and population studied

- Teacher education institutions (500)
- Teacher preparation programmes: primary (349) & lower secondary (226), primary +lower secondary (176)
- Future teachers in each programme: 13,871 (primary), 8,207 (lower secondary)
- Educators in each programme (mathematics, mathematics pedagogy and general education): 5,190
- Curriculum documents

# Sampling procedures

- Two-stage sampling design using randomization:
  - Representative sample of teacher education institutions (each country provided universe)
  - Samples of future teachers and educators within each institution
- Special software used in each country to select samples
- Sampling errors were computed using balanced half-sample repeated replication (B.R.R.)

# Data collection instruments

- Future teacher questionnaire:
  - Personal background characteristics
  - Opportunity to learn
  - Mathematics content and pedagogy knowledge
  - Beliefs
- Educator questionnaire
  - Personal /academic background characteristics
  - Opportunity to learn
  - Beliefs
- Institutional questionnaire

# Variation in Structure of Participating Programmes: Concurrent & Consecutive

1	2	3	4	5	6	7	8	9	10	11	12
PRIMARY											
Georgia, Germany, Poland, Russia, Switzerland											
Ontario, Taipei, Philippines, Spain, Switzerland, USA											
Botswana, Chile, Norway, Ontario, Singapore											
Mathematics specialists: Germany, Poland, Malaysia, Singapore, Thailand, USA											
SECONDARY											
Chile, Germany, Norway, Ontario, Philippines, Singapore, Switzerland, USA											
					Malaysia, Oman, Poland, Russia, Singapore, Thailand, USA						

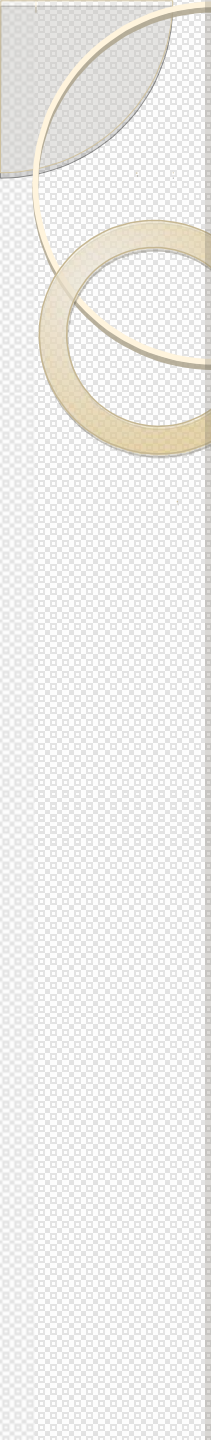

# Policy Contexts

- *Teacher employment system*: position or career based
- *Teacher working conditions*: critical (Botswana, Philippines); moderate (Chile & USA), Good (Germany, Spain, Switzerland, Chinese Taipei)
- *Salaries*: Very low (Philippines); high (Taipei, Singapore, Germany); compensated with incentives (Thailand, Malaysia)

# Attractiveness and entry requirements

- *Selection on entry to T. Ed.* (number of places): Strong, mixed and weak controls.
- *Entry requirements:* secondary school only, secondary school + mathematics; secondary school+ tertiary level studies in maths.
- *Attractiveness and status of teaching profession:* High, mixed, low
- *Primary & lower secondary teachers with Maths specialisation,* more likely in: Canada, Chinese Taipei, Germany, Malaysia, Oman, Poland, Russian Federation and Singapore.

# Accreditation/evaluation of Teacher Education Programmes

- Weak regulations or voluntary systems
- Accreditation for higher education institutions, but not for teacher education programmes
- Internal evaluations by institutions: no external evaluations
- Accreditation or evaluation of teacher education by independent, external accrediting agency – can disaccredit

# Requirements for entry into the profession

- Graduation only
- Graduation + further tests by external agencies
- Graduation + further tests + probation and assessment of teaching performance

# Future teacher characteristics: Gender distribution some countries (%)

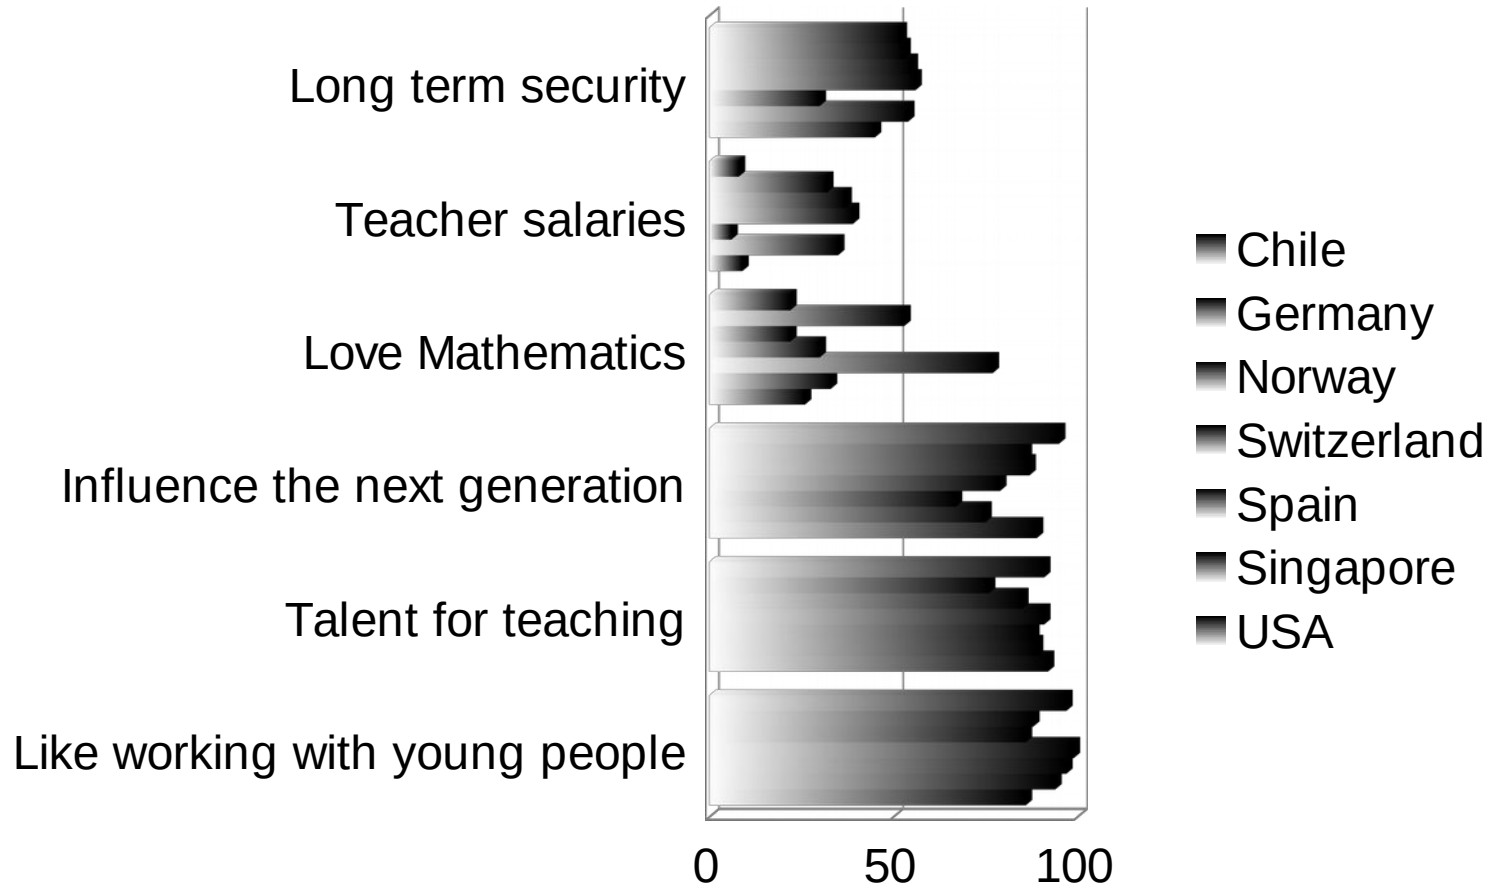

# Future Teacher Characteristics: highest education level of father % (some countries)

	<b>Botswana</b>	<b>Chile</b>	<b>Ch. Taipei</b>	<b>Germany</b>	<b>Philippines</b>	<b>USA</b>
Primary	29	10	12	5	26	2
L. Second.	14	12	15	19	8	0,2
U. Second	5	36	37	4	24	34
Post Second	5	11	15	29	11	10
First degree	4	10	17	15	13	18
Beyond	2	4	5	15	2	20

Source: TEDS-M Future Teacher Questionnaire

# Reasons for becoming a teacher (%)

Source: Future Teacher Questionnaire

# Characteristics of sampled educators

- Three types: mathematics and mathematics pedagogy (41%), only pedagogy (43%), and all three specialisations (16%).
- 60% or more male maths and maths pedagogy educators in Chinese Taipei, Georgia, Oman & Singapore
- 60% or more female pedagogy educators in Georgia, Germany, Philippines, Poland, Russian Federation & Singapore.
- Maths & Maths pedagogy educators: Large proportion of doctoral degrees in mathematics (50%) in Chinese Taipei, Georgia, Germany, Oman and Poland. Lowest: Chile, Malaysia, Philippines & Switzerland.
- Masters degrees in Education: Botswana, Russian Federation, Thailand. Highest number of doctoral degrees in education among pedagogy educators in Chinese Taipei, Georgia, Oman, Poland, Russian Federation.

# Knowledge of mathematics:

## Contents:

- Number & operations
- Geometry & measurement
- Algebra & functions
- Data & chance

## Cognitive Domains:

- Knowing (recall, recognise, compute, retrieve, measure, classify/order)
- Applying (select, represent, model, implement, solve routine problems)
- Reasoning (analyse, generalise, synthesise/integrate, justify, solve non-routine problems)

# Knowledge domains in mathematics pedagogy

- Mathematical curricular knowledge
  - Knowledge of planning for mathematics teaching and learning
  - Enacting mathematics for teaching and learning
- i.e. Knowing the school mathematics curriculum
  - i.e. Predicting typical students' responses including misconceptions
  - i.e. Generating fruitful questions
  - Analyzing the contents of students' questions

# Presentation of results: Maths knowledge

- *Anchor points (2)*: descriptions of performance of future teachers with scores at specific points in the scale:
  - Probability that the person with the score will answer correctly the question (70% & 50%)
- ☐ Two sets of anchor points for primary and lower secondary knowledge
- ☐ Also standardisation of results: 500 mean and 100 standard deviation.
- ☐ Results are presented by programme group

# Primary mathematics knowledge results (MCK)

- Wide range of achievement across all countries
- Wide range of achievement within countries
- Within each programme group the difference between the highest mean MCK score and the lowest mean MCK score is at least 100 points
- In programmes preparing generalists for primary and lower secondary, Botswana & Chile had difficulties with MCK items. In Norway scores were higher.

# Variability among results by institution in chile

## Primary mathematics pedagogy (MPCK) results

- Most programmes preparing generalist teachers (4 years) scored below the MPCK anchor point, but two of five were above the 500 average.
- In generalist primary-secondary programmes Chile and Botswana scored lower than on MCK, but Norway was more successful

# Lower secondary MCK results

- Programmes (primary & secondary) with or without maths specialisation found items difficult. In only three countries were results above the mean.
- Programmes with maths specialisation (lower and upper secondary), tended to score above the international mean (7 out of 12 countries)

# Lower secondary MPCK results

- Four out of ten programs with generalist or special preparation for primary & lower secondary achieved mean scores above international mean.
- In programmes preparing for lower and upper secondary, more than 93% of sample achieved above the international mean, and in 5 countries they also scored above the MPCK anchor point.

# Some idea of variability of MCK scores across Primary programme types (low & high)

	<b>Programm e 1</b>	<b>Programm e 2</b>	<b>Programm e 3</b>	<b>Programm e 4</b>
Georgia	345			
Russian Federation	536			
Philippines		440		
Chinese Taipei		623		
Chile			413	
Norway (2)			553	
Malaysia				488
Poland				614

# **BELIEFS: Future teachers & Educators**

# Types of beliefs studied

## About the nature of mathematics:

- As a set of rules and procedures (calculational)  
*(Mathematics involves the remembering and application of definitions, formulas, mathematical facts & procedures)*

- As a process of enquiry (conceptual)  
*(If you engage in mathematical tasks you can discover new things)*

## About mathematics achievement: Mathematics as fixed ability:

*(To be good in mathematics you have to have a kind of “mathematical mind”)*

## About learning mathematics:

- Through following teacher directions (direct transmission)  
*(Pupils learn mathematics best by attending to teacher explanations)*

- Through active involvement (cognitive constructivist)  
*(Teachers should allow pupils to figure out their own ways to solve mathematical problems)*

# How beliefs were measured?

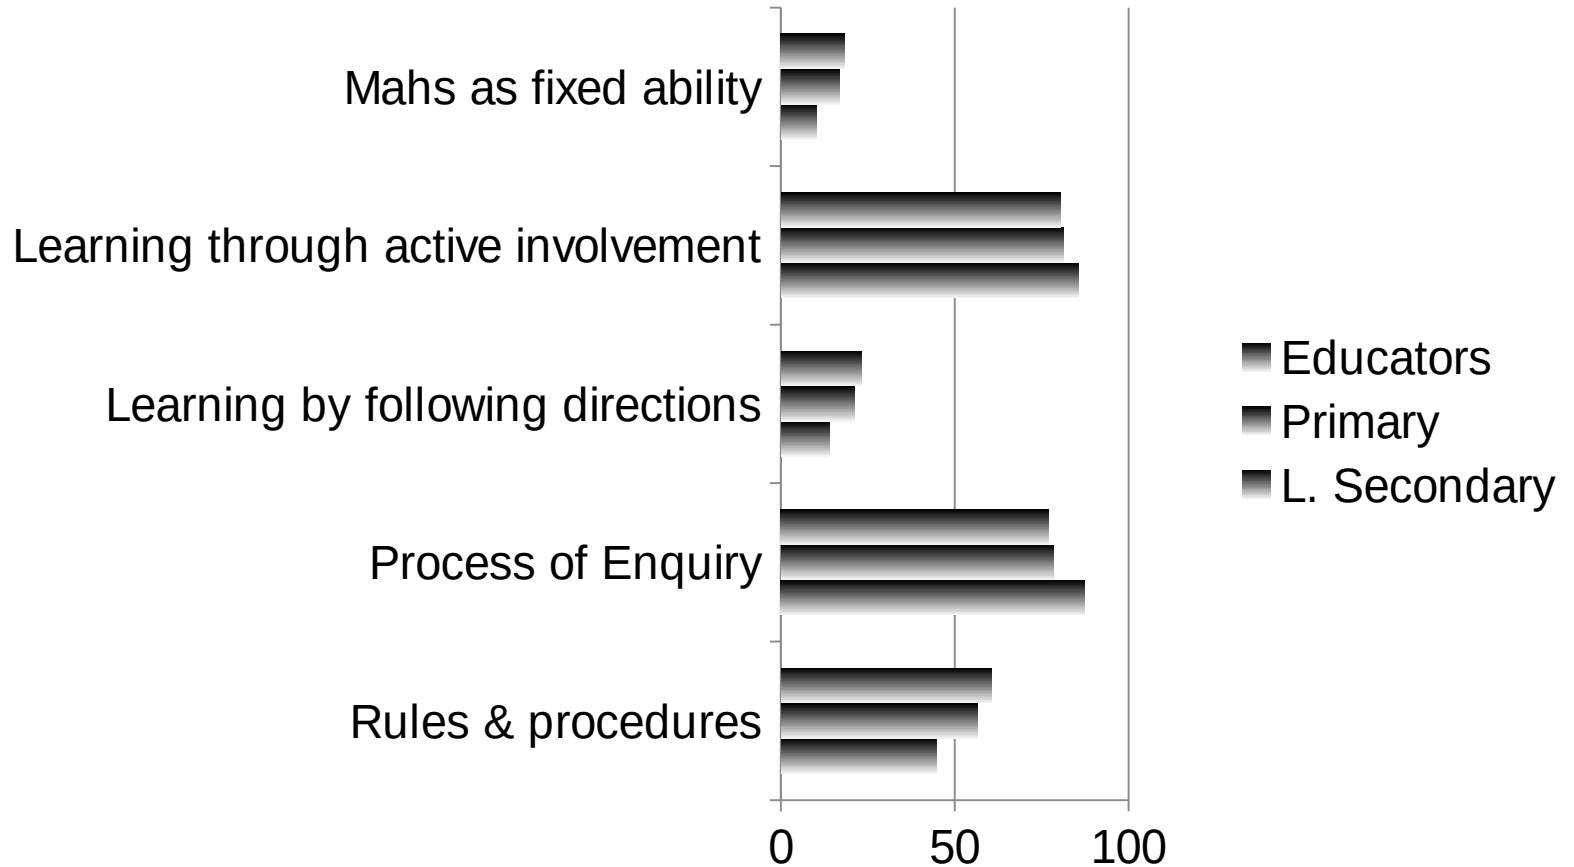

- Agreement/ disagreement scales (34 items) for future teachers and educators
- Items were scaled using Item Response Theory (IRT): 10 (neutral response)
- Percent endorsement

# Some general conclusions about beliefs

- Beliefs consistent with the conceptual orientation endorsed by future teachers and educators in most countries.
- But in six countries beliefs consistent with the calculational orientation were endorsed. In another three countries these beliefs were strongly rejected.
- A group of six countries endorsed the conceptual orientation, but also gave reasonable endorsement to the calculational orientation.

# Beliefs among future teachers & educators in Chile

# Relationship between beliefs and knowledge

- Correlations within countries show that:
  - Those future teachers who endorse beliefs in maths as a process of enquiry and learning math through active involvement have greater knowledge of MCK and MPCK
  - Those who in general endorse beliefs in maths as a set of rules & procedures, learning maths through following directions and maths as a fixed ability, have lesser knowledge of MCK and

# **Opportunity to learn**

# How OTL was examined

- Future Teacher and Educators' questionnaire
- Analysis of syllabuses provided by each participating country
- Information provided in the Institutional Questionnaire

# What was asked in the questionnaires?

## Opportunity to learn:

- Tertiary mathematics (list of topics provided)
- School mathematics (list of topics provided)
- Mathematics education (list of topics provided)
- Instructional practice and planning
- Assessment used and practice
- Education pedagogy
- Teach diverse students
- Reflect on and improve teaching practice
- Teach mathematics in school-based experiences
- Participatory research based and problem oriented pedagogy
- In a coherent programme

# Main conclusions resulting from questionnaire data

- OTL to learn tertiary mathematics varies across programme groups
- OTL to learn school maths highly uniform in numbers, measurement and some geometry, but highly variable in functions, data representation, calculus and validation
- OTL to learn aspects of MPCK such as planning, assessments and learning varied across programme groups
- OTL to teach diverse populations: many countries report rare or no opportunities
- OTL general pedagogy high in all programmes
- Field experience and practice strong in all programmes
- Pedagogy in maths education courses varied
- Coherence varied across programme groups

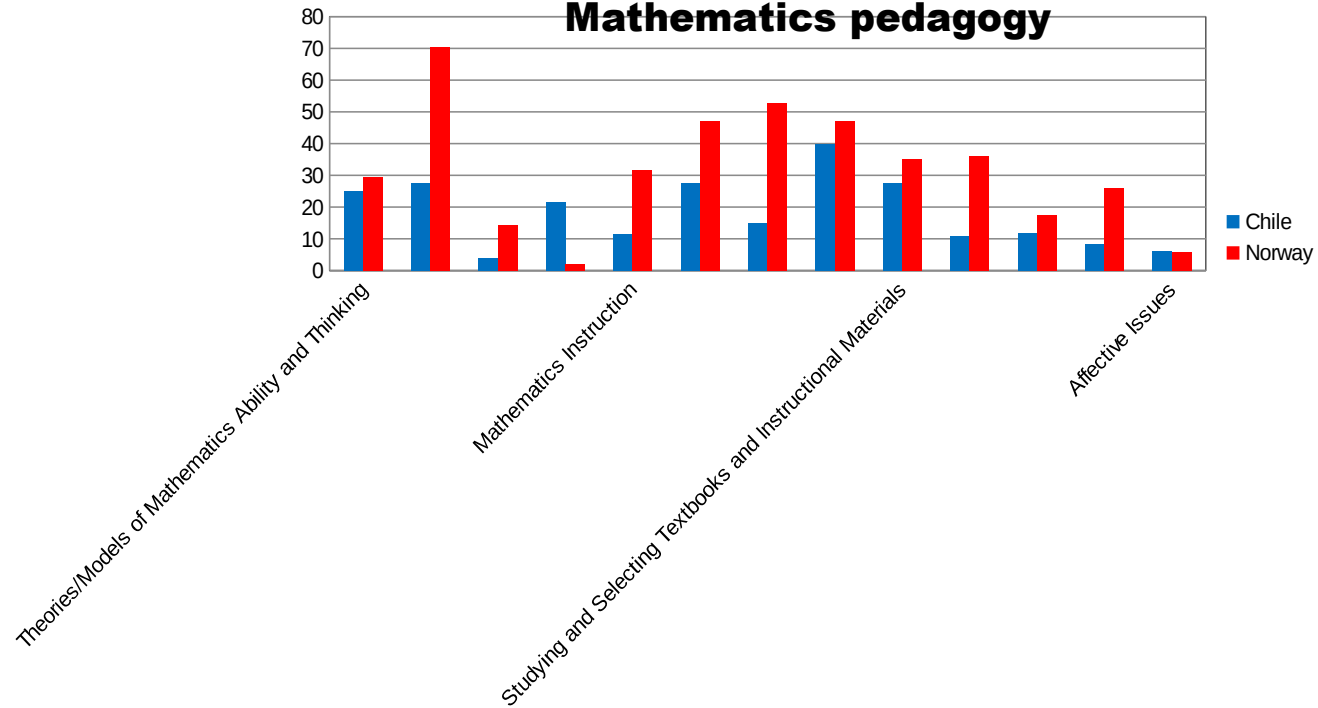

# An example of results of curricular analysis in two countries

## Comparison Chile - Norway, Institutions, Average School mathematics

# MPCK topics covered in two countries

**Comparison Chile - Norway, Institutions, Average Mathematics pedagogy**

## Conclusions: What have we learned from the IEA TEDS-M?

- An incredible achievement in terms of the complexity of the study and the variation in teacher education programmes involved
- Strong influence on results of the policy contexts, very clear in the case of Chile
- Variations among countries, teacher education institutions and programmes speak against league tables – reporting will take this into consideration

## Conclusions: Focus on content knowledge matters

- Not surprising: being prepared as specialists in primary programmes yields higher MCK and MPCK than in generalist programmes
- Teachers prepared as lower and upper secondary teachers have better MCK and MPCK than those prepared only as lower secondary.
- The key issue affects the preparation of primary teachers: generalists, some specialisation or strong specialisation – TEDS-M shows that specialisation leads to more knowledge.

MANY THANKS
